Low Latency Interest Rate Markets

Theory, Pricing & Practice

Nicholas Burgess

PART ONE: Theory

IR Markets, Products & Models

- Introduction to IR Markets
- Interest Rate Swaps
- IR Products & CDS
- Yield Curves
- IR Risk
- Credit Models

PART TWO: Pricing & Practice

Case Studies

- IRS Pricing Formulae
- IRS Pricing Case Study
- Asset Swap Structuring
- Asset Swap Pricing Case Study
- Pricing Tricks & Rules of Thumb

Quant Research Papers

https://ssrn.com/author=1728976

Support Materials: Quant Research, C++ and Excel Examples

https://github.com/nburgessx/SwapsBook

PART ONE - THEORY

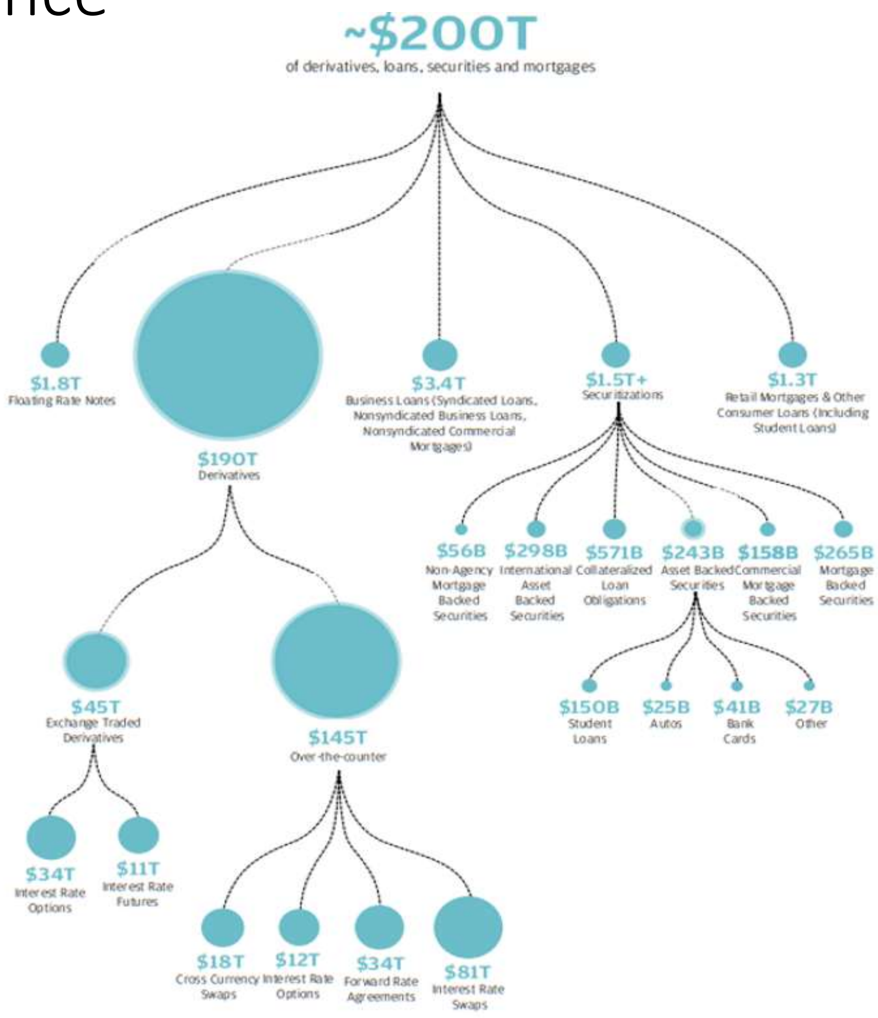
Interest Rate Markets - Project Finance

Purpose

- To Facilitate Government, Corporate & Project Finance
- Mortgages, Corporate Loans, Gov Projects & Infrastructure
- e.g. Hospitals, Transport (HS2), Energy & Defence Projects

Market Size

- Market Size by Notional: \$200T (US) + \$150T (EU)
- Derivatives, Loans & Securities
- All Referencing LIBOR, until Recently



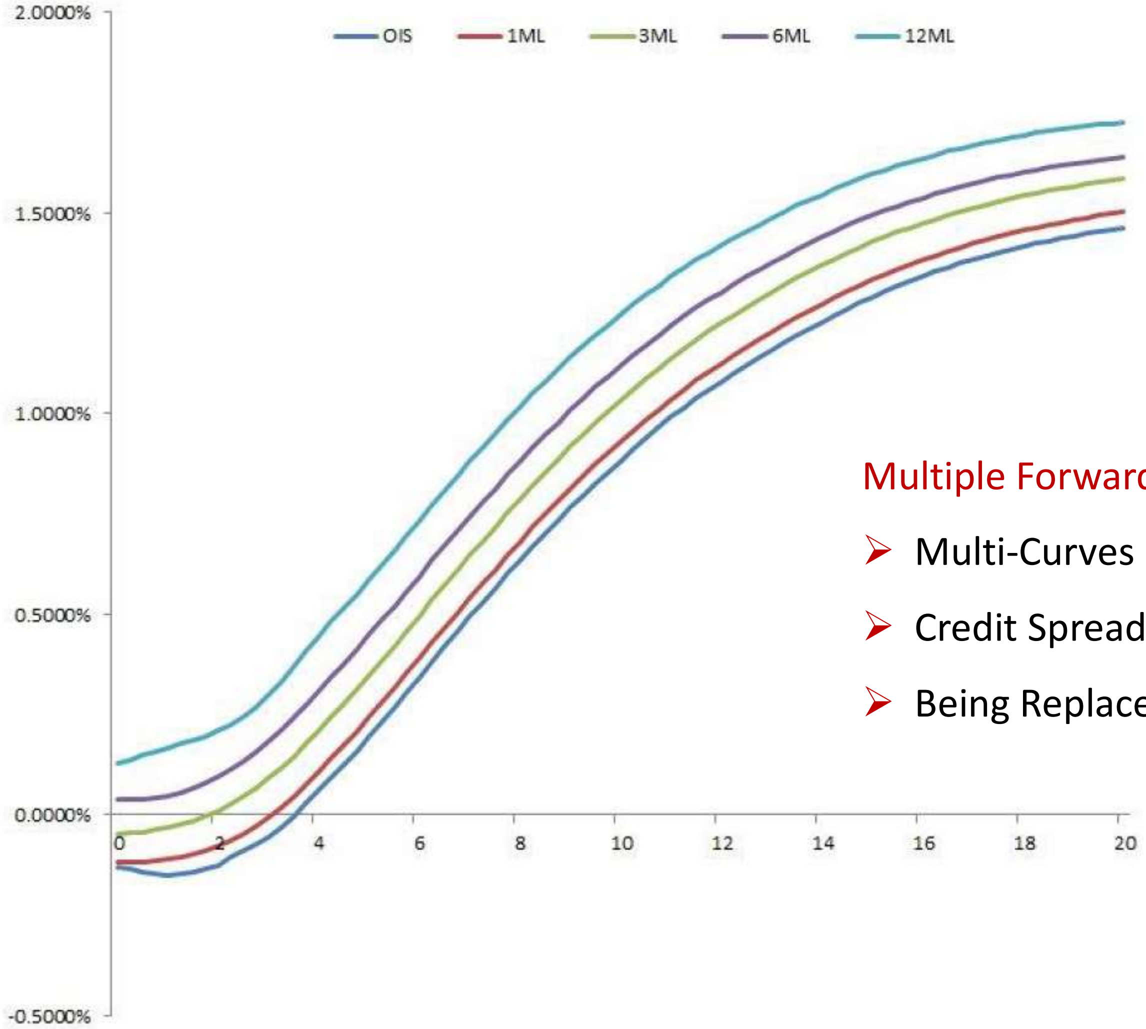
Interest Rate Markets – Why the need for Speed?

- Cleared Electronic Trading & Auto-Hedging
- Real-Time, Highly Liquid & High Precision (Bid-Offer 1/10th bps i.e. USD 10 per MM)
- Trading Horizon: High Frequency Trading (HFT) vs Long-Term Fund Performance

USD Semi vs 3M Libor		
31) 1 Year	0.750 / 0.754	+0.014
32) 2 Year	1.045 / 1.049	+0.017
33) 3 Year	1.284 / 1.287	+0.018
34) 4 Year	1.467 / 1.471	+0.015
35) 5 Year	1.617 / 1.621	+0.014
36) 6 Year	1.750 / 1.754	+0.012
37) 7 Year	1.866 / 1.870	+0.011
38) 8 Year	1.966 / 1.970	+0.011
39) 9 Year	2.052 / 2.056	+0.011
40) 10 Year	2.126 / 2.129	+0.011
41) 12 Year	2.250 / 2.254	+0.007
42) 15 Year	2.376 / 2.380	+0.006
43) 20 Year	2.497 / 2.501	+0.002
44) 25 Year	2.558 / 2.563	+0.003
45) 30 Year	2.592 / 2.597	+0.000
46) 40 Year	2.612 / 2.621	+0.003
47) 50 Year	2.598 / 2.604	+0.004

USD Spreads vs Treasuries		
71) 1 Year	4.282 / 5.295	+0.687
72) 2 Year	10.248 / 10.806	-0.073
73) 3 Year	3.337 / 3.895	-0.029
74) 4 Year	1.350 / 1.900	+0.161
75) 5 Year	-4.020 / -3.454	+0.138
76) 6 Year	-8.100 / -7.550	+0.157
77) 7 Year	-13.577 / -13.036	+0.382
78) 8 Year	-11.100 / -10.550	+0.335
79) 9 Year	-9.888 / -9.088	+0.492
80) 10 Year	-9.775 / -9.275	+0.537
81) 12 Year	2.520 / 3.320	+0.204
82) 15 Year	-3.599 / -2.799	+0.110
83) 20 Year	-10.100 / -9.600	+0.150
84) 25 Year	-22.800 / -22.250	+0.150
85) 30 Year	-38.058 / -37.491	+0.351

Interest Rate Markets – Yield Curve Models



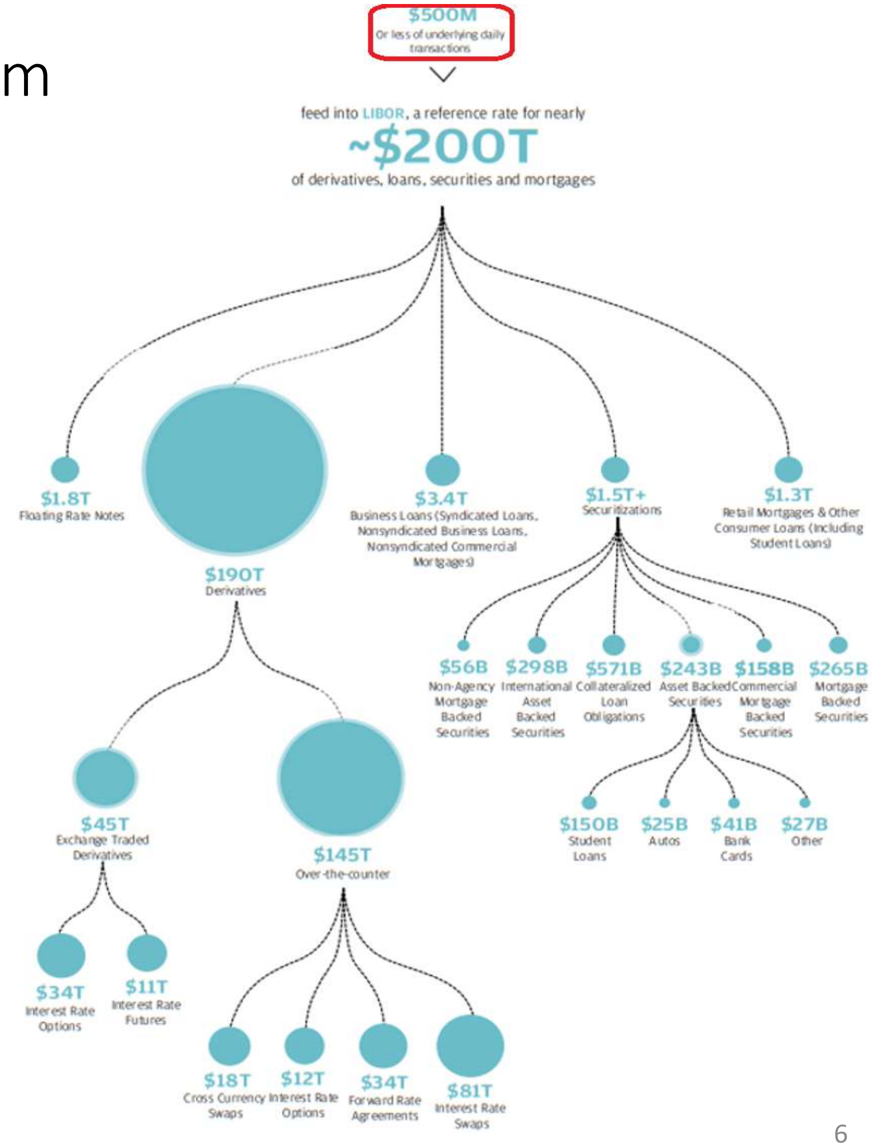
Required to Forecast Future Interest Rates

- Use Liquid Market Instruments
- To Imply Forward Rates & Disc. Factors

Multiple Forward Curves

- Multi-Curves Have In-Built Credit Spread (Tenor Homogenous)
- Credit Spread Determined by Loan Repayment Frequency
- Being Replaced by Single RFR Curves (Similar to OIS Curve)

Interest Rate Markets – The LIBOR Problem



The Problem with LIBOR

- LIBOR Market Transactions < $500M
- Rates Do Not Reflect Actual Borrowing Levels
- LIBOR Levels Increasingly Set by Panel/Expert Judgement

Market Size

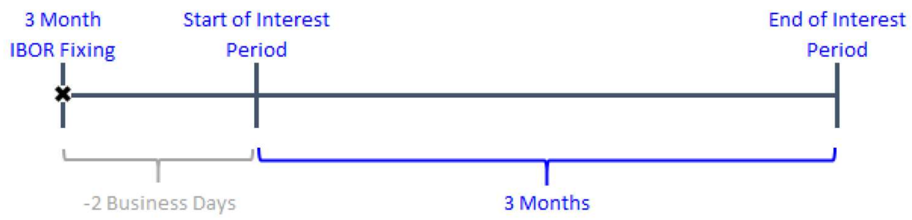
- Market Size by Notional: $200T (US) + $150T (EU)

Large Market Driven by Small Number of LIBOR Transactions!!!

Interest Rate Markets – LIBOR Benchmark Replacement

LIBOR Rates

- Low Transaction Volume / Panel Based
- Forward Looking Term Rate, known In-Advance
- In Built Credit Risk Component

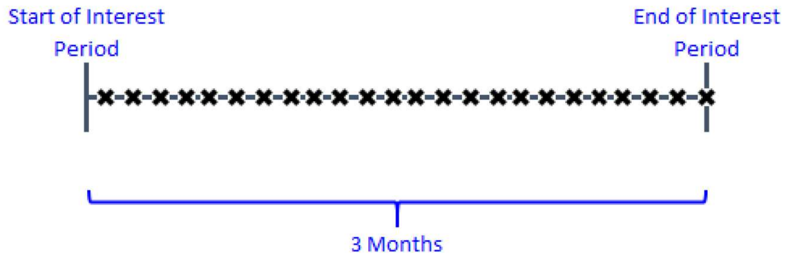


Rate: Term Rate Fixed In-Advance
Coupon: Determined in Advance

Risk-Free Rates (RFRs)

- Transaction Based
- Backward Looking Rate, Known In-Arrears
- No Credit Component i.e. Risk-Free

3 Month Risk-Free Rate



Rate: Daily O/N Fixings leading to an Averaged Effective Rate
Coupon: Determined in Arrears

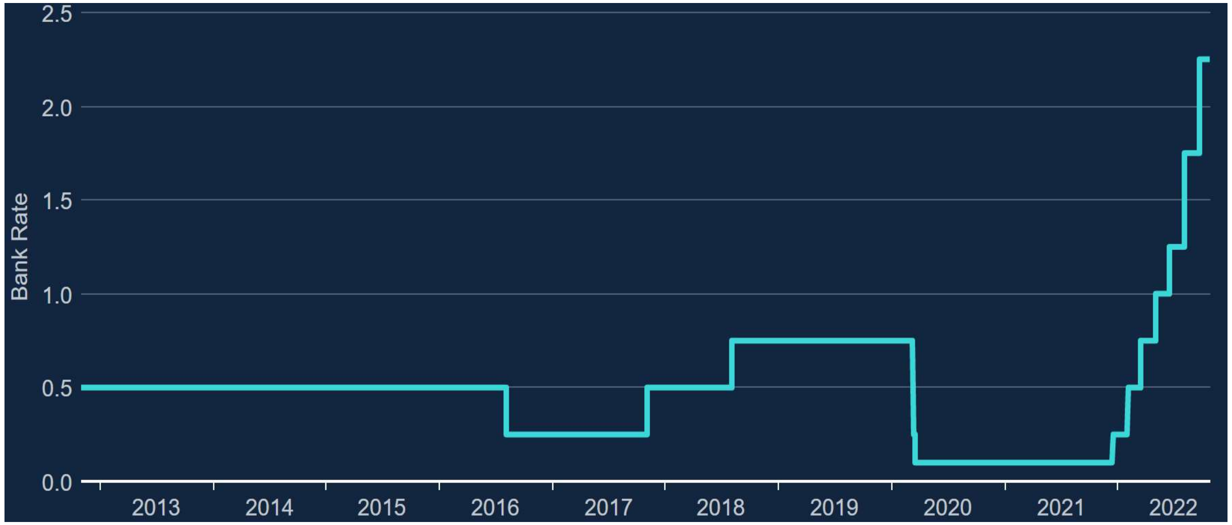
Market Changes

- Legacy LIBOR Contracts, Fall-Back Rates
- New RFR Products & Yield Curve Model Changes

Interest Rate Markets – Project Finance Risks & Solutions

1. Interest Rate Risk

- Finance linked to variable interest rates
- Use IRS to Fix Borrowing Costs



2. Foreign Exchange / Currency Risk

- International Finance
- Use Cross Currency Swaps to Fix FX Rates

3. Credit Default Risk

- Bonds, Bi-Lateral and Non-Cleared Transactions
- Risk of Counterpart Default
- Credit Default Swaps, Collateral & CSA Agreements

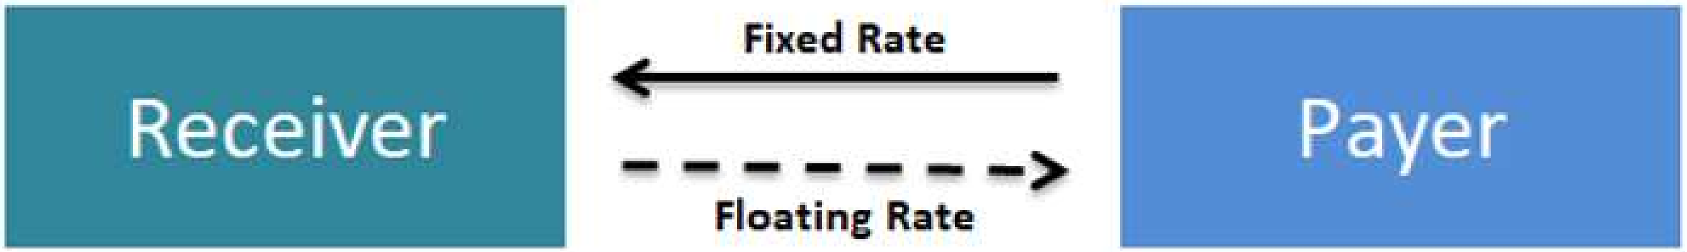
4. No money to invest?

- Use Asset Swaps to Borrow Funds to Invest in Bonds
- Pay LIBOR + Spread (Finance) to Receive Bond Coupons
- Floating Spread includes Funding + Credit Costs

Interest Rate Swaps – Fixed or Variable Borrowing Costs?

Project Finance

- Project Finance Naturally Incurs Variable Interest Costs (LIBOR + Spread)
- Exposed to Interest Rate Risk (Market may Move Against Us)



Hedging Interest Rate Risk

- Use IRS to Exchange Floating for Fixed Interest (or Vice Versa)
- We Can Choose to Fix Borrowing Costs
- We Also Trade IRS for Speculative Purposes

Interest Rate Swaps –Market Quotes & Pricing

USD Semi vs 3M Libor			
31) 1 Year	0.750 / 0.754	+0.014

84) 25 Year	-22.800 / -22.250	+0.150
85) 30 Year	-38.058 / -37.491	+0.351

- Standard Tenors: Spread Over US Treasury Yields
- New Swaps: Par Rate (%), since PV=0
- Existing Swaps: Present Value (USD)

Interest Rate Swaps – Present Value

Present Value is the Sum of Discounted Cash Flows

$$Swap\ PV = \underbrace{\sum_{i=1}^{n} N\, \mathrm{r}\, \tau_i\, P(t_0, t_i)}_{Fixed\ Cash\ Flows} - \underbrace{\sum_{j=1}^{m} N\left(l_{j-1} + s\right) \tau_j\, P\left(t_0, t_j\right)}_{Floating\ Cash\ Flows}$$

Interest Rate Swaps – Par Rate

- New Swaps Trade at Par i.e. PV = 0
- Consequently such Swaps Quote as a Par Rate
- This is the fixed rate that makes both trade legs equal

$$Swap\ PV = \underbrace{r \sum_{i=1}^{n} N\, \tau_i\, P(t_0, t_i)}_{Fixed\ Cash\ Flows} - \underbrace{\sum_{j=1}^{m} N\left(l_{j-1} + s\right) \tau_j\, P\left(t_0, t_j\right)}_{Floating\ Cash\ Flows} = 0$$

Rearrange for the Fixed Rate r and call this the Par Rate, p

$$Par\ Rate, p = \frac{PV(Float\ Leg)}{\sum_{i=1}^{n} N\, \tau_i\, P(t_0, t_i)} = \frac{PV(Float\ Leg)}{Annuity(Fixed\ Leg)^1}$$

[1] Par Rates calculated in terms of Annuity or PV01

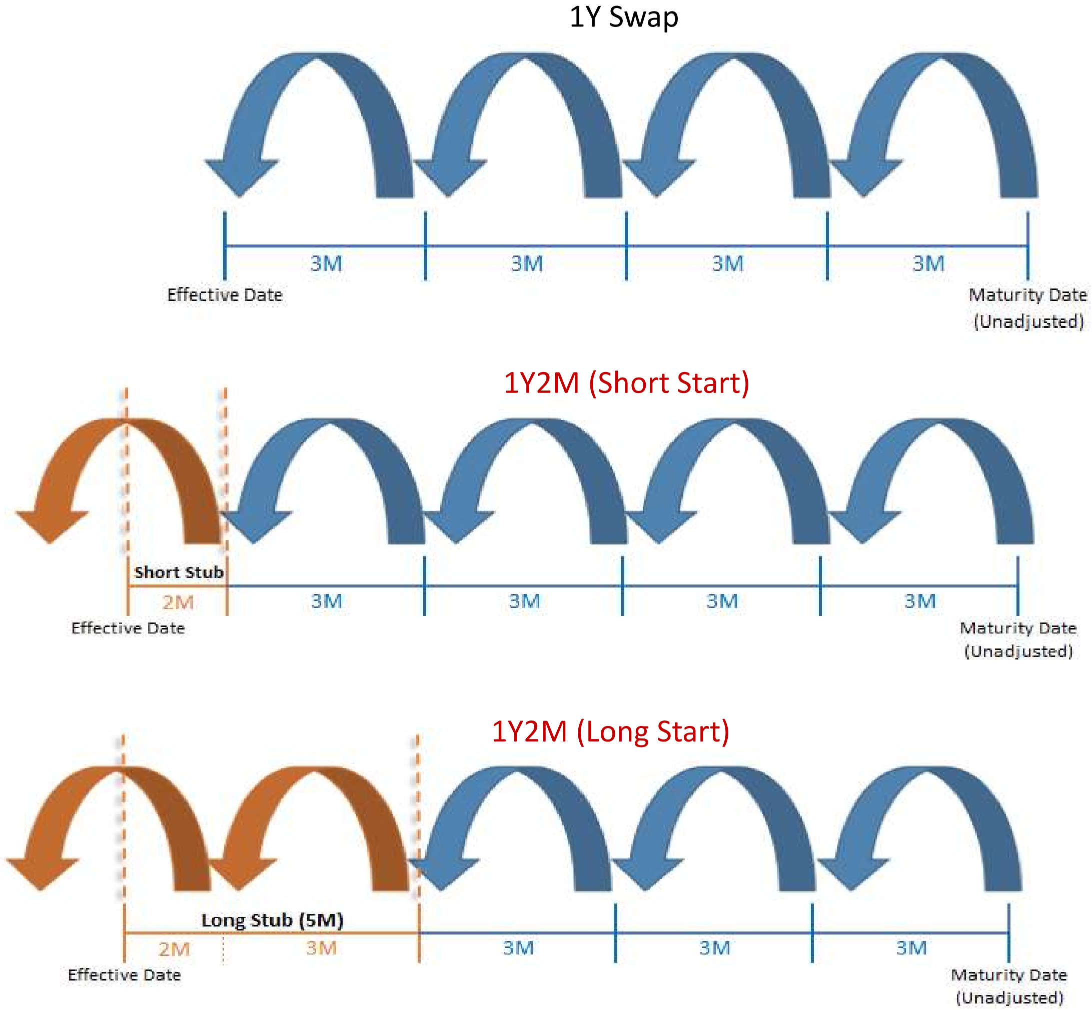
Interest Rate Swaps - Schedules & Stubs

Swap Schedules

- Backwards vs Forward Rolling Schedules
- Unadjusted to Preserve Roll Day
- Holiday Adjustments Ex-Ante
- Accrual Day Count Conventions

Broken-Dated Swaps

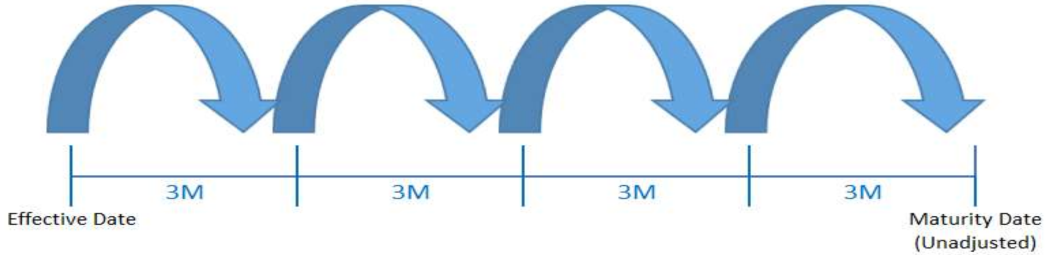
- Stubs & Stub Rates (Linear Interp)
- Short Start/End, Long Start/End
- Market Default: Short Start



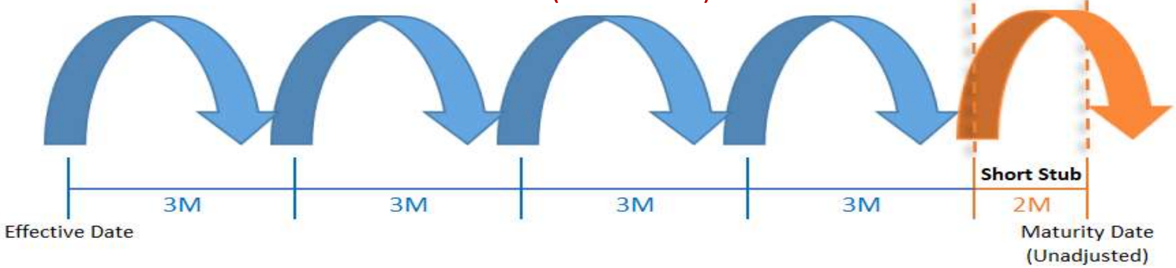
Interest Rate Swaps - Forward Roll Schedules

Forward Roll Schedules

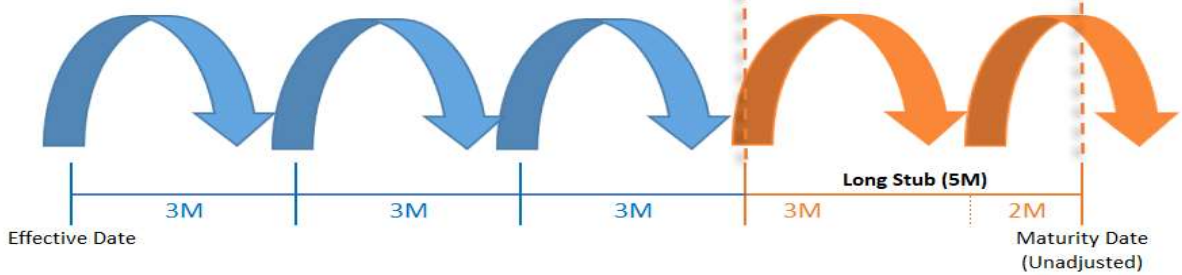
- End Stubs
- Regular, Short End or Long End
- Less Popular



1Y2M (Short Start)



1Y2M (Long Start)



IR Products – Tenor & Xccy Basis Swaps

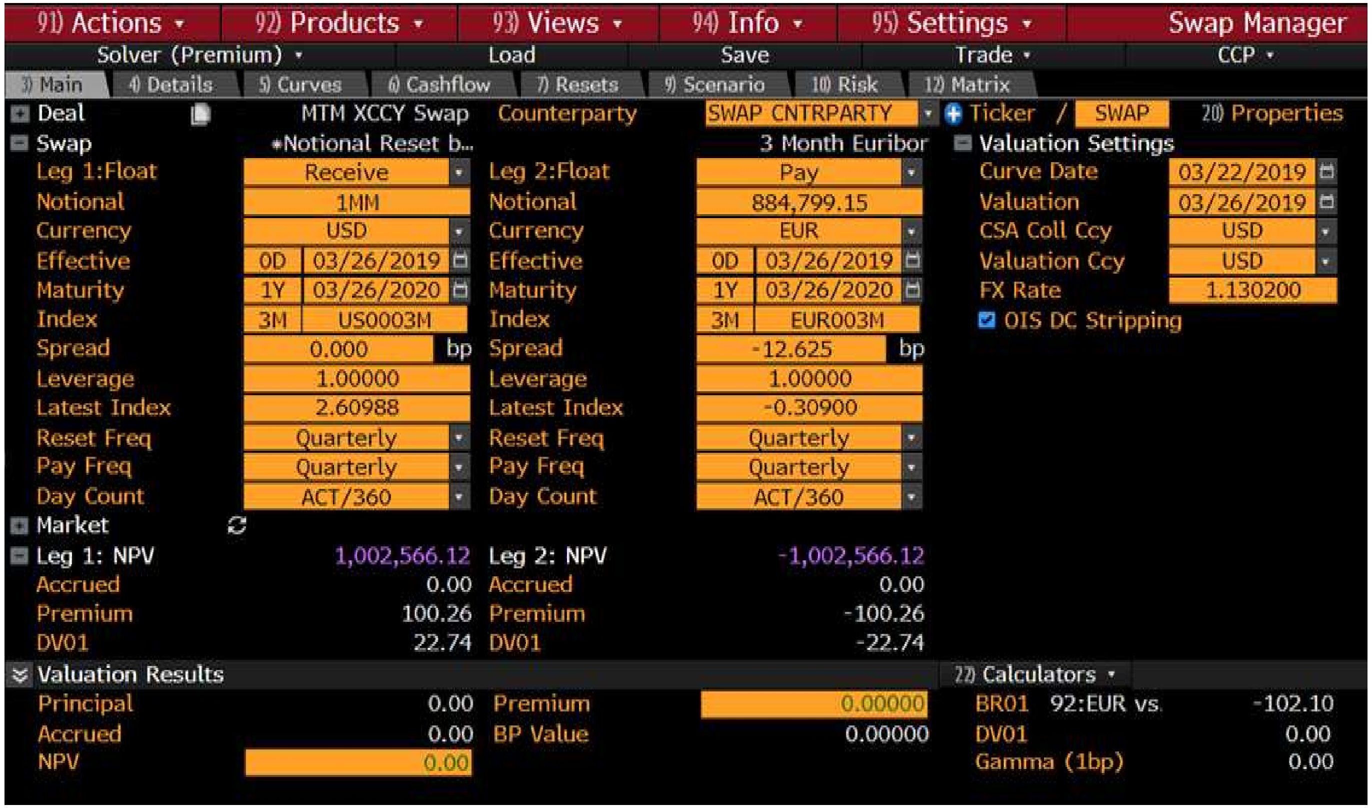
Tenor Basis Swaps

- Float vs Float (Same Currency)
- Exchange USD3M for USD6M say
- Match Project Cash Flow Frequency

Tenor Basis Swap Formulae (December 30, 2015).
Available at SSRN: https://ssrn.com/abstract=2959605

Xccy Basis Swaps

- Float vs Float (Different Currencies)
- Exchange USD3M for EUR3M say
- Marked-to-Market / FX Notional Resets
- Reduces XVA Costs

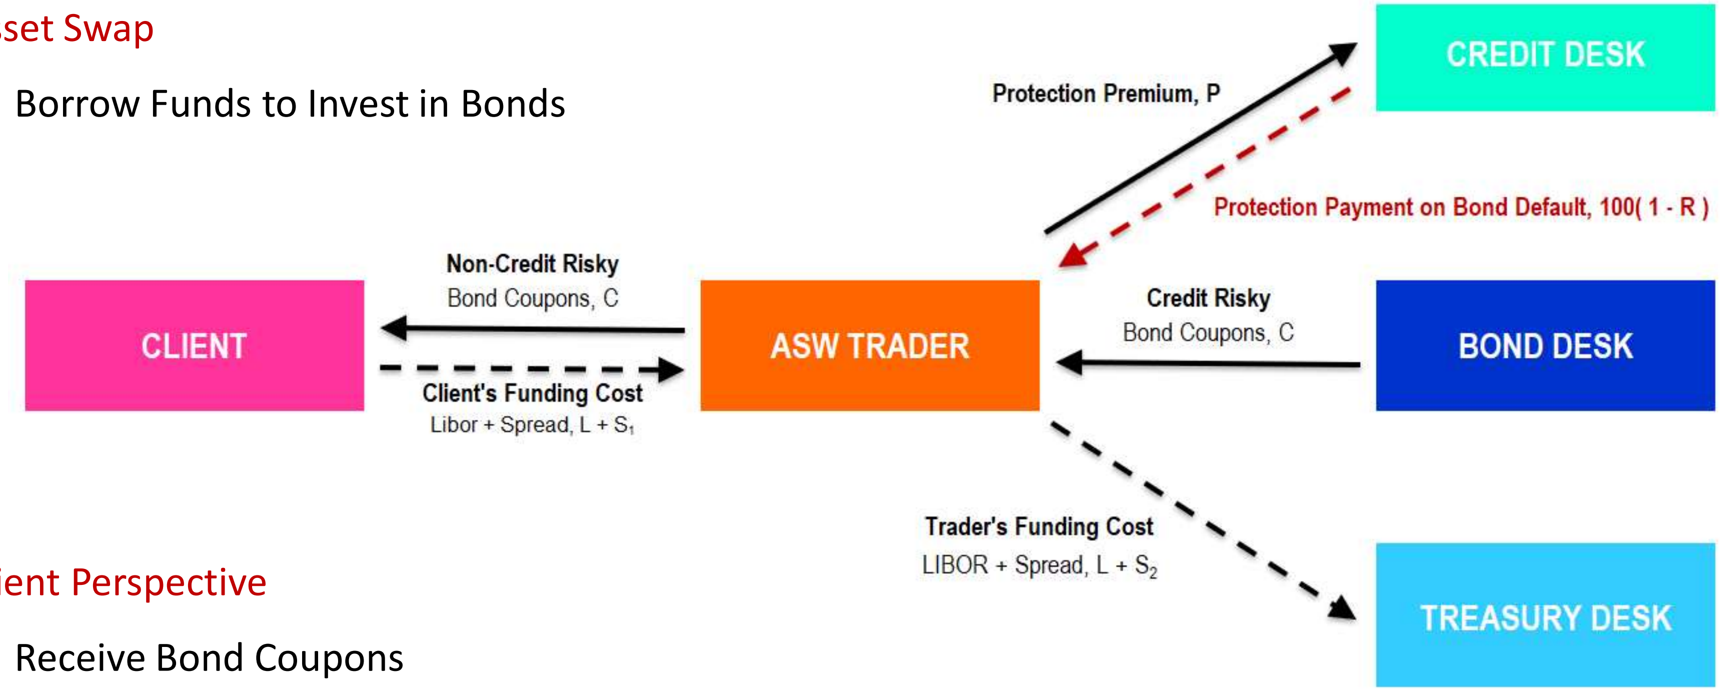


An Illustrated Step-by-Step Guide of How to Price Cross Currency Swaps (November 11, 2018).
Available at SSRN: https://ssrn.com/abstract=3278907

IR Products – Asset Swaps

Asset Swap

- Borrow Funds to Invest in Bonds



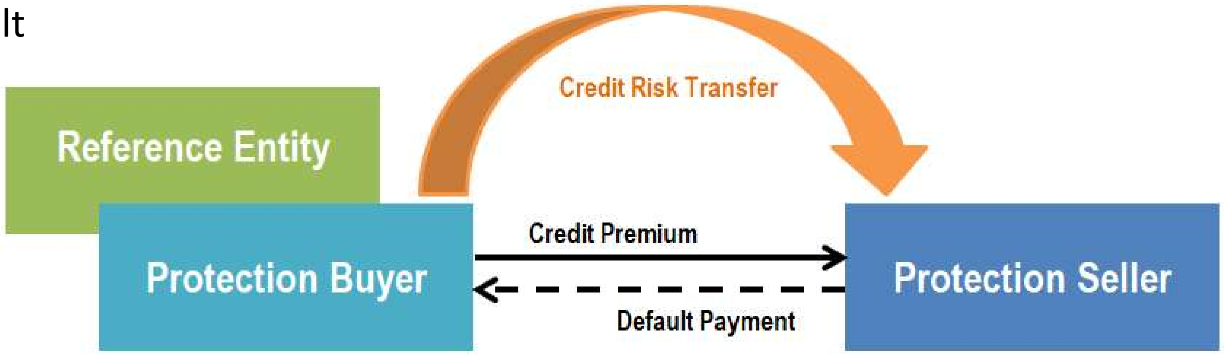
Client Perspective

- Receive Bond Coupons
- Pay LIBOR + Spread
- Spread Includes Finance + Credit Costs

IR Products – Credit Default Swaps (CDS)

Insurance Against Counterparty Default

- Insuring Bond Notional Invested
- Pay Fixed Insurance Premium
- Receive Protection Payment on Default



Credit Crisis & ISDA Big Bang (2008)

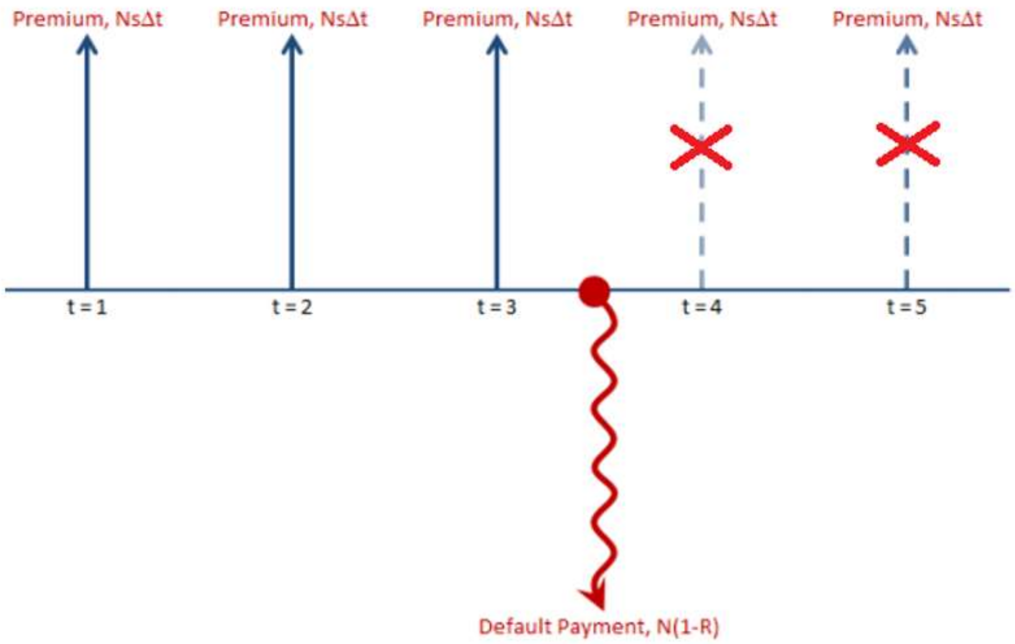
- Standardized & Cleared Contracts (IMM Dates[1])
- Increased Liquidity
- Accrued Interest, Clean & Dirty Prices

[1] Third Wednesday of Mar, June, Sep and Dec

IR Products – CDS Pricing

Pricing

- Similar to Interest Rate Swap Pricing
- With Additional Survival Probability Term, Q(t,T)
- $Q(t,T) = exp\left(-\int_t^T \lambda(t,u)du\right)$
- λ is the 'Hazard Rate' (instantaneous prob of default)



Buying Credit Protection

$$PV = PV(Protection\ Leg) - PV(Premium\ Leg)$$

$$PV(Premium\ Leg) = \sum_{i=1}^{n} \underbrace{N\ s\ \tau_i \Delta(t_{i-1}, t_i)}_{Coupon}\ \underbrace{Q(t_i)}_{P(Survive)}\ \underbrace{P(t_0, t_i)}_{\substack{Discount\\Factor}}$$

$$PV(Protection\ Leg) = \sum_{i=1}^{n} \underbrace{N(1-R)}_{\substack{Loss\ Given\\Default}}\ \underbrace{[Q(t_{i-1}) - Q(t_i)]}_{\substack{Default\ within\\Premium\ Period}}\ \underbrace{P(t_0, t_i)}_{\substack{Discount\\Factor}}$$

IR Risk

What are the main IR risks?

- Discount Risk (DF01)
- Forward Risk (PV01)
- Discount + Forward Risk (DV01)

Risk Calculation Methods

- Analytical
- Numerical Risk (Benchmark)
- Using Yield Curve Jacobian
- Automatic Adjoint Differentiation (AAD)

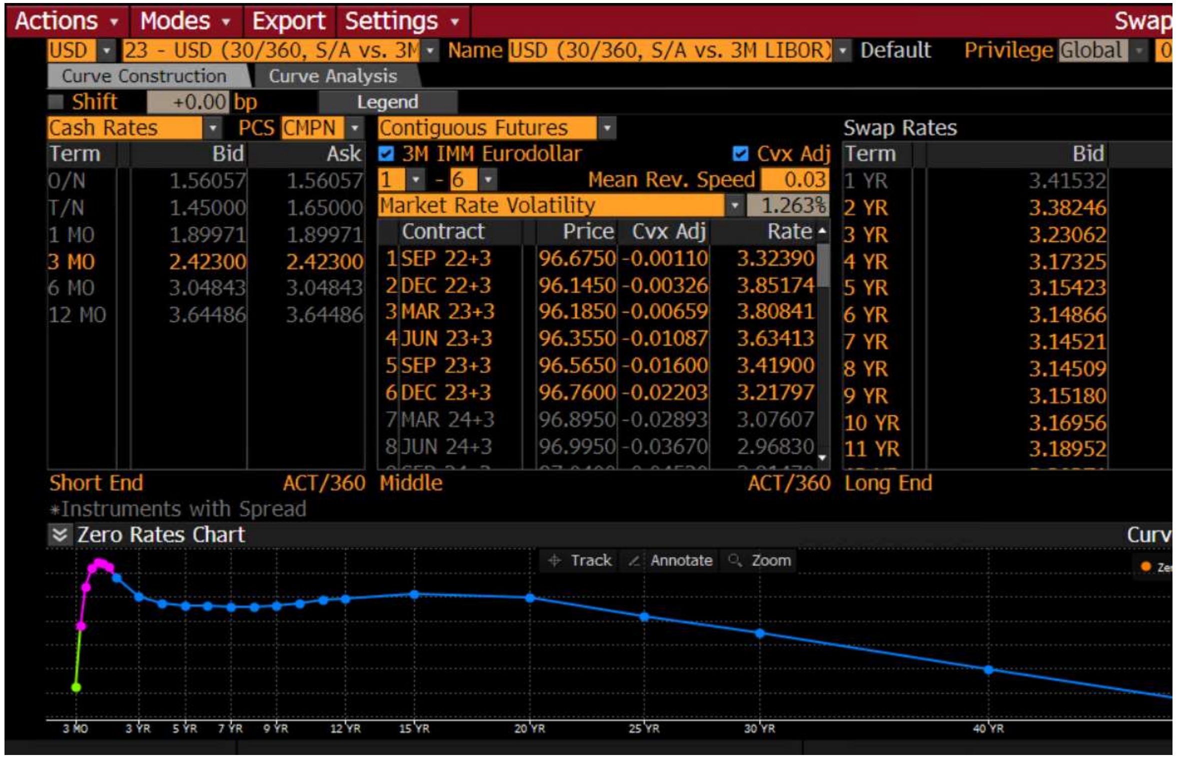
Yield Curves - Calibration

Model Inputs & Outputs

- Liquid Market Instrument Quotes [IN]
- Forward Rates [OUT]
- Discount Factors [OUT]

Calibration Process

- Choose State Variable[1]
- Choose Interpolator (Functional Form)
- Solve and Imply Forwards & Disc Factors[2]



[1] Popular choices: forward rate, disc factor, logDF, zero rate etc.

[2] May need to differentiate and/or integrate state variable, $P(t,T) = \exp\left(-\int_t^T f(t,u)du\right)$

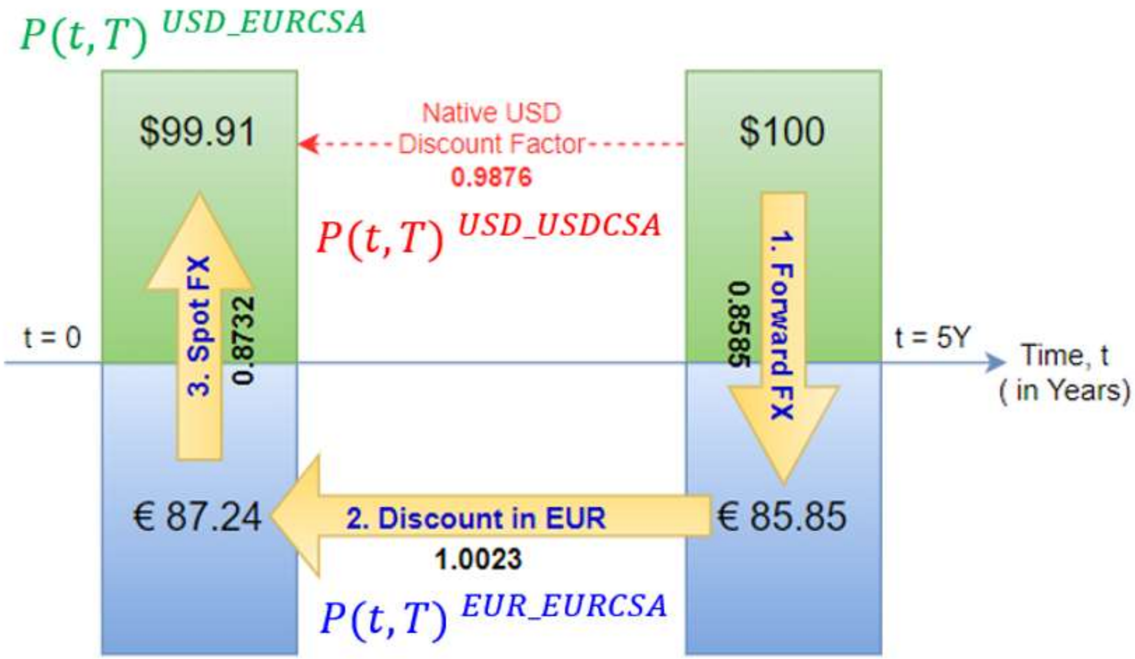
Yield Curves – Collateral & CSA Curves

Collateral & CSA Curves

- Calibrate to FX Forwards & Xccy Swaps
- FX Forward Invariance (FX Carry Trade)
- Impacts Discount Factors Only
- No Impact on Forward Rates

Advanced CSA Topics

- Cheapest to Deliver (Multiple CSAs)
- Collateral Switch Options



$$f(t,T)^{USD/EUR} = s(t)^{USD/EUR} \underbrace{\left(\frac{P(t,T)^{EUR\_USDCSA}}{P(t,T)^{USD\_USDCSA}}\right)}_{USD\ CSA} = s(t)^{USD/EUR} \underbrace{\left(\frac{P(t,T)^{EUR\_EURCSA}}{P(t,T)^{USD\_EURCSA}}\right)}_{EUR\ CSA}$$

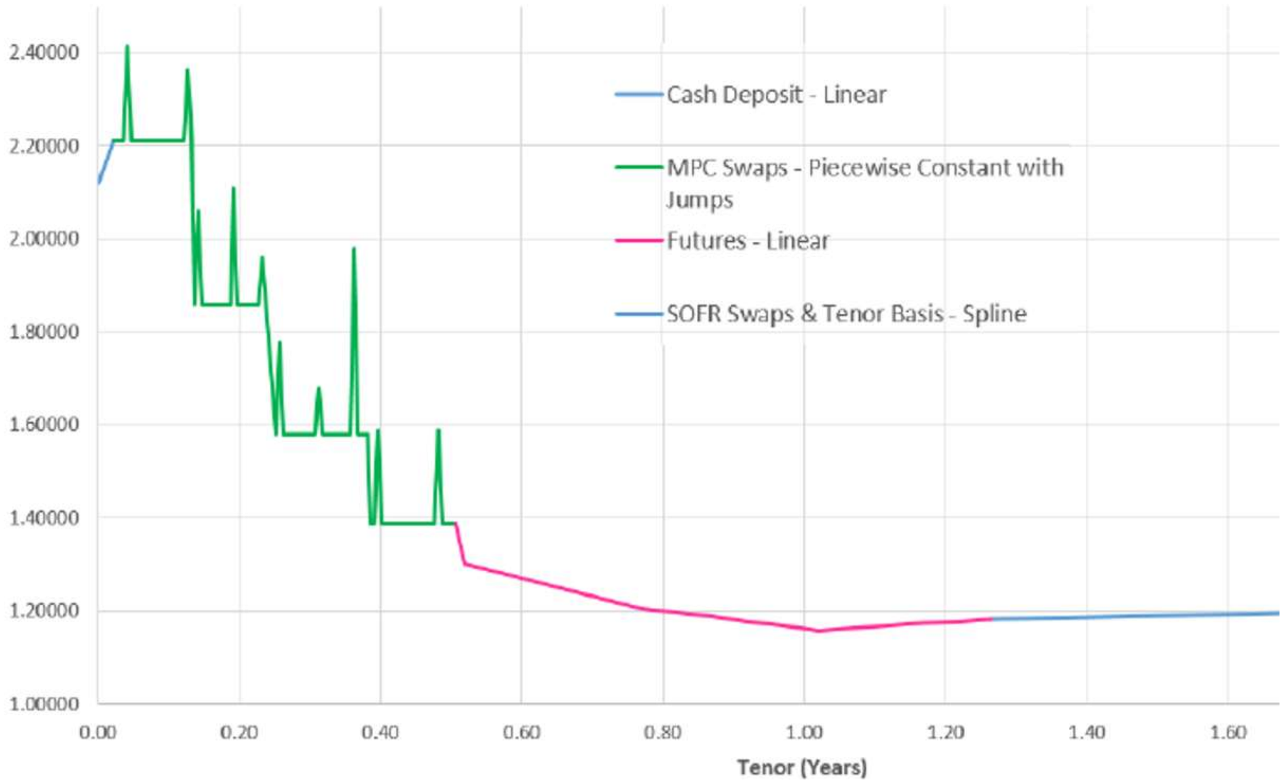
Yield Curves - Features

Curve Features & Considerations

- Underlying Instrument Behaviour
- Mixed Interpolation Schemes
- Turn-of-Year Effects (ToYs)

Advanced Features for Electronic Markets

- Curve Jacobian
- Ultra-Fast Curves & Analytical Risk
- Automatic Adjoint Differentiation (AAD)



Yield Curves – Curve Jacobian

Electronic HFT Usage

- Ultra-Fast Rebuilds
- Real-Time Risk
- Auto-Hedging

Inverse Curve Jacobian, dL/dP

By-Product of Calibration Process

- Measures Changes in Market Instrument Quotes (P) on Forward Rates (L)
- First Order Derivative Matrix, dP/dL (Inverse Required)
- Controls Hedge and Risk Buckets (Same as Numerical Bumping)
- Use Implicit Function Theorem (IFT) to modify Risk Buckets (see Appendix)

Yield Curves – Ultra-Fast Rebuilds

New Forwards

$$L_{New} = L_{Old} + dL$$
$$= L_{Old} + \left({}^{dL}/_{dP}\right).\, dP$$

Implementation

- Slow Curve (Full-Rebuild) Ticks in Background (ca. 10ms)
- Fast Curve (Jacobian Method) Used Between Refreshes (Real-Time)

Yield Curves – Real-Time Bucketed Risk

Requirements

- Curve Jacobian
- Trade or Portfolio Jacobian

$$DV01(Analytical) = \underbrace{1bps \times \frac{dPV}{dL}}_{\substack{Pricing \\ Jacobian}} \times \underbrace{\frac{dL}{dP}}_{\substack{Curve \\ Jacobian}}$$

Risk as a Matrix Operation

- Can be Parallelized / Vectorized
- Matrix Dimensions Must Agree
- Interpolation & Forward Mapping
- Barycentric Weights, $w_j(t)$

$$p(t) = \sum_{j=0}^{n} w_j(t) f(t_j), \qquad w_j(t) = \frac{\prod_{k=0,\,k\neq j}^{n}(t - t_k)}{\prod_{k=0,\,k\neq j}^{n}(t_j - t_k)}$$

Inverse Curve Jacobian, dL/dP

Yield Curves – Automatic Adjoint Differentiation (AAD)

Trade Jacobian

- AAD Can Compute Instrument Price & Risk Simultaneously
- Direct Differentiation of Code + Implicit Function Theorem (IFT)
- Exact & Fast (X4 Pricing Time)

Tangent & Adjoint Modes

- Tangent Mode (dot) : Forward Mode - One Risk at a Time
- Adjoint Mode (bar) : Backward Mode - All Risks Simultaneously
- Activation Inputs Control Risk Outputs

Implementation Methods

- By Hand (See Appendix for Swap DV01 Risk Example)
- Derivative Code by Overloading, DCO/C++
- Professional Tools: Adept, NAG

Pricing Calculations

$$x \rightarrow f(x) \rightarrow g(f) \rightarrow h(g) \rightarrow y$$

Chain Rule: Forwards

$$\frac{\cancel{df}}{dx} \cdot \frac{\cancel{dg}}{\cancel{df}} \cdot \frac{\cancel{dh}}{\cancel{dg}} \cdot \frac{dy}{\cancel{dh}} = \frac{dy}{dx}$$

Chain Rule: Backwards

$$\frac{dy}{\cancel{dh}} \cdot \frac{\cancel{dh}}{\cancel{dg}} \cdot \frac{\cancel{dg}}{\cancel{df}} \cdot \frac{\cancel{df}}{dx} = \frac{dy}{dx}$$

Yield Curves – AD Tangent Mode Example

Tangent Mode

- Differentiate Forwards using ‘Dot’ Notation
- One Risk at a Time, Controlled by Dot Input Activation Variables 1 or 0
- For $\frac{df}{dx_1}$ and $\frac{df}{dx_2}$ must call tangent method twice

`tangent(2.0, 3.0, 1.0, 0.0);`	// Input: x1 = 2, x2 = 3, x1_d = 1, x2_d = 0	Output: 8
`tangent(2.0, 3.0, 0.0, 1.0);`	// Input: x1 = 2, x2 = 3, x1_d = 0, x2_d = 1	Output: 3

Function Derivatives using Tangent Mode

`double tangent( double x1, double x2, double x1_dot, double x2_dot )`			
`{`			
`double a = x1*x1;`	// Step 1:	$a = x_1^2$	
`double a_dot = 2*x1*x1_dot;`	// Tangent:	$\dot{a} = 2x_1 \cdot \dot{x}_1$	$\dot{a} = 2x_1$
`double b = 2*a;`	// Step 2:	$b = a$	
`double b_dot = 2*a_dot;`	// Tangent:	$\dot{b} = 2 \cdot \dot{a}$	$\dot{b} = 4x_1$
`double c = x2;`	// Step 3:	$c = x_2$	
`double c_dot = x2_dot;`	// Tangent:	$\dot{c} = \dot{x}_2$	$\dot{c} = 1$
`double d = 3*c;`	// Step 4:	$d = 3c$	
`double d_dot = 3*c_dot;`	// Tangent:	$\dot{d} = 3 \cdot \dot{c}$	$\dot{d} = 3$
`double f = b + d;`	// Step 5:	$f = 2x_1^2 + 3x_2$	
`double f_dot = b_dot + d_dot;`	// Tangent:	$\dot{f} = \dot{b} + \dot{d}$	
`return f_dot;`	// Result:	$\dot{f} = 4x_1 + 3$	
`}`			

Simple Function $f(x_1, x_x) = 2x_1^2 + 3x_2$ with Tangent Derivatives

`double function( double x1, double x2 )`		
`{`		
`double a = x1*x1;`	// Step 1:	$a = x_1^2$
`double b = 2*a;`	// Step 2:	$b = 2x_1^2$
`double c = x2;`	// Step 3:	$c = x_2$
`double d = 3*c;`	// Step 4:	$d = 3x_2$
`double f = b + d;`	// Step 5:	$f = 2x_1^2 + 3x_2$
`return f;`		
`}`		

Simple Function: $f(x_1, x_x) = 2x_1^2 + 3x_2$

Source Code: https://onlinegdb.com/kKqaS6hJT

Yield Curves – AD Adjoint Mode Example

Adjoint Mode (Reverse Mode)

- Backwards Differentiation with ‘Bar’ Notation
- Forward Sweep then Back Propagate Risk
- Computes All Risks at Same Time
- Risk Controlled By Bar Input Activation Variable 1 or 0
- Adjoint Method Calculates Both $\frac{df}{dx_1}$ and $\frac{df}{dx_2}$

```
double function( double x1, double x2 )
{
    double a = x1*x1;        // Step 1:    a = x_1^2
    double b = 2*a;          // Step 2:    b = 2x_1^2
    double c = x2;           // Step 3:    c = x_2
    double d = 3*c;          // Step 4:    d = 3x_2
    double f = b + d;        // Step 5:    f = 2x_1^2 + 3x_2
    return f;
}
```

Simple Function: $f(x_1, x_x) = 2x_1^2 + 3x_2$

Source Code: https://onlinegdb.com/kKqaS6hJT

```
    adjoint(2.0, 3.0, 1.0);  // Input: x1 = 3, x2 = 2, f_bar    Output: df/dx_1= 8 and df/dx_2 = 3
```

Function Derivatives using Adjoint Mode

```
void adjoint( double x1, double x2, double f_bar )
{
    // Forward Sweep
    double a = x1*x1;               // Step 1:    a = x_1^2
    double b = 2*a;                 // Step 2:    b = 2x_1^2
    double c = x2;                  // Step 3:    c = x2
    double d = 3*c;                 // Step 4:    d = 3x_2
    double f = b + d;               // Step 5:    f = 2x_1^2 + 3x_2

    // Back Propagation
    double b_bar = f_bar;           // Step 5:    b_bar  = 1     from input variable
    double d_bar = f_bar;           // Step 5:    d_bar  = 1     from input variable
    double c_bar = 3*d_bar;         // Step 4:    c_bar  = 3
    double x2_bar = c_bar;          // Step 3:    x2_bar = 3     df/dx_2 = 3
    double a_bar = 2*b_bar;         // Step 2:    a_bar  = 2
    double x1_bar = 2*x1*a_bar;     // Step 1:    x1_bar = 4x_1  df/dx_1 = 4x_1

    // Display Results
    std::cout << "df/dx1: " << x1_bar << std::endl;      // x̄_1 = df/dx_1 = 4x_1
    std::cout << "df/dx2: " << x2_bar << std::endl;      // x̄_2 = df/dx_2 = 3
}
```

Simple Function $f(x_1, x_x) = 2x_1^2 + 3x_2$ with Adjoint Derivatives

Credit Models – Hazard Rates & Survival Probabilities

Calibration Summary

- Yield Curve is an Input
- Calibrate to Bonds or CDS
- Imply Hazard Rates, λ
- Used for Survival Prob, Q(t,T)

Common Assumptions

- Piecewise Constant[1]
- Deterministic Hazard Rates

Rule of Thumb

$$\lambda = \frac{S}{(1-R)}$$

$$Q(t,T) = exp\left(-\int_t^T \lambda(t,u)du\right)$$

$$P(t,T) = \exp\left(-\int_t^T f(t,u)du\right)$$

[1] As often there is only a single calibration instrument

PART TWO – PRICING & PRACTICE

Interest Rate Swap – Annuity is the Key Pricing & Risk Factor

It's All About Annuity

- Pricing & Risk Expressed in Terms of Annuity
- Similarly Float Legs Expressed in Annuity Terms
- Can Be Used to Convert a Float Leg to Fixed Leg
- Useful for Low Latency Pricing

$$A_N = N \sum_{i=1}^{n} \tau_i P(t_0, t_i)$$

Low Latency Interest Rate Swap Pricing

Electronic Rates Markets & Low Latency Interest Rate Swap Calculations (May 31, 2022).
Available at SSRN: https://ssrn.com/abstract=4125565

Key Formulae:

- PV = (r – p) Annuity(Fixed)
- Par Rate = PV(Float) / Annuity(Fixed)
- PV01 = Annuity(Fixed) x 0.01%
- DV01 = PV01 + DF01 = PV01 for Par Swaps

$$Swap\ PV = PV^{Fixed\ Leg} - PV^{Float\ Leg}$$

$$= r \sum_{i=1}^{n} N_i \tau_i P(t_0, t_i) - \sum_{j=1}^{m} N_j l_{j-1} \tau_j P(t_0, t_j)$$

$$= (r - p) A_{Fixed}$$

Interest Rate Swap – Pricing & Risk Example

Compute Annuity A_N

= USD 4,863,971.74

$$A_N = N \sum_{i=1}^{n} \tau_i P(t_0, t_i)$$

PV = (r – p) A_N

= (5.00% - 1.59%) A_N

= USD 167,892.11

Par Rate = PV(Float) / A_N

= 75,306 / A_N

= 1.5482%

PV01

= $A_N \times 0.01\%$

= USD 486.40

Credit Default Swap – Pricing & Risk Example

Compute Risky Annuity $\tilde{A}_N$

= USD 49,512,369.11

$$\tilde{A}_N = N \sum_{i=1}^{n} \tau_i Q(t_i) P(t_0, t_i)$$

PV = (r – p) $\tilde{A}_N$

= (5.00% - 1.39%)$\tilde{A}_N$

= USD 1,786,536

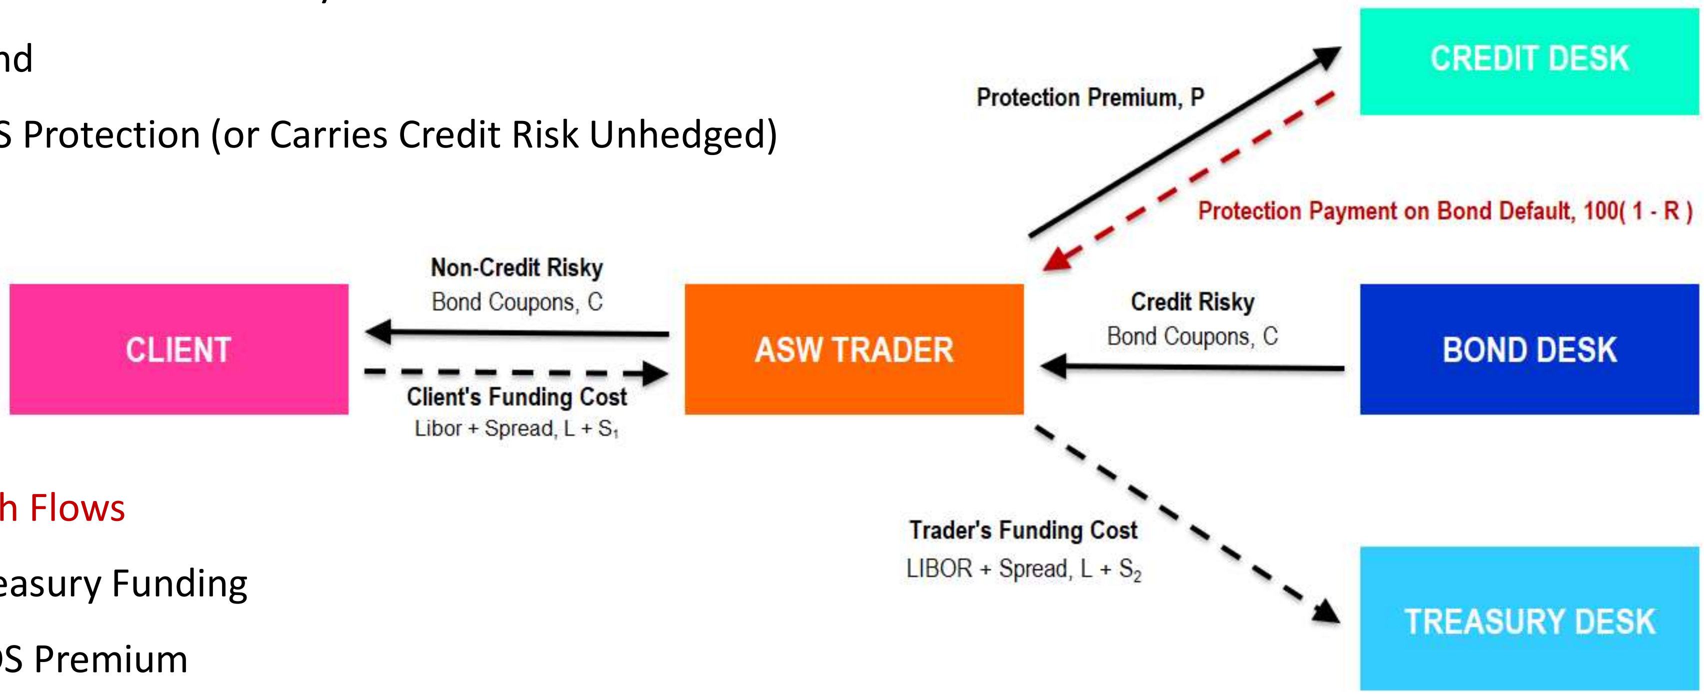
CS01 = $\tilde{A}_N \times 0.01\%$

= USD 486.40

Asset Swap – Structuring the Asset Swap Spread

Trader Creates Synthetic Asset Swap

- Borrow Cash from Treasury to Purchase Bond
- Buy Bond
- Buy CDS Protection (or Carries Credit Risk Unhedged)



Trader Cash Flows

- Pays Treasury Funding
- Pays CDS Premium
- Receives Bond Coupons and Passes on to Client
- Client Pays All Costs + Commission as a Spread over LIBOR (or RFR)

Asset Swap – Pricing as a Spread Over LIBOR (or RFR)

- ASW Spread - Par-Par Spread
- MMS Spread - Yield-Yield Spread[1]

[1] Y/Y Spread Between Swap Rate and Benchmark Gov't Bond Yield

Asset Swap – Pricing using Par-Par Method

Pricing as a PV

- Valuation Method for Existing Swaps, Unwinds and Novations (trade transfers)
- Again Present Value is Simply the Sum of Incoming and Outgoing Cash Flows
- An Upfront Par-Adjustment is Made if the Underlying Bond not Trading at Par, i.e., 100

$$PV^{Asset\ Swap} = \underbrace{\phi \mathrm{r}^{Fixed} \sum_{i=1}^{n} N_i \tau_i P(t_0, t_i)}_{Fixed\ Leg} - \underbrace{\phi \sum_{j=1}^{m} N_j \left(l_{j-1} + s\right) \tau_j P\left(t_0, t_j\right)}_{Float\ Letg} + \underbrace{\phi \mathrm{N}_1 (100 - B)\%}_{Par\ Adjustment}$$

Pricing as a Par Spread

- New Asset Swaps Price to Par i.e., zero
- Instead Quote as a Par Spread s
- Rearrangement of PV formula with PV=0

$$s = \left(\frac{\left(\mathrm{r}^{Fixed} - p^{Market}\right) A^{Fixed} + (100 - B)\%}{A^{Float}} \right)$$

Fast Pricing & Risk – Using Annuity Factors

Multiples Pricing and Risk

Pricing Tricks - Identifying Annuity Factors

Pricing Tricks & Rules of Thumb

- Identify the Annuity Factor
- Key Pricing and Risk Factor
- Assume $A_N^{Fixed} = A_N^{Float}$

Annuity

$$A_N = N \sum_{i=1}^{n} \tau_i P(t_0, t_i)$$

Credit Risky Annuity

$$\widetilde{A_N} = N \sum_{i=1}^{n} \tau_i Q(t_i) P(t_0, t_i)$$

Interest Rate Swaps

$$PV^{Swap} = \phi(r - p) A_N$$

$$DV01^{Swap} = \phi A_N \times 0.01\%$$

Credit Default Swaps

$$PV^{CDS} = \phi(s - p)\, \widetilde{A_N}$$

$$CS01^{CDS} = \phi \widetilde{A_N} \times 0.01\%$$

Asset Swap Spreads

$$s^{ASW} = \left(\frac{(r-p)\%\, A + (100-B)\%}{A}\right)$$

Pricing Tricks – Fast Annuity Factors

Pricing Tricks & Rules of Thumb

- Assume Annual Coupons & Discount Factors = 1.0
- This gives $A_N = NT$ and $A = T$
- Resulting Prices are an upper-bound

Annuity

$$A_N = N \sum_{i=1}^{n} \tau_i P(t_0, t_i) = NT$$

Credit Risky Annuity

$$\widetilde{A_N} = N \sum_{i=1}^{n} \tau_i Q(t_i) P(t_0, t_i) = NT$$

- We could also assume survival probabilities Q(t) = 1.0

Interest Rate Swaps

$$PV^{Swap} = \phi(r - p)NT$$

$$DV01^{Swap} = \phi NT \times 0.01\%$$

Credit Default Swaps

$$PV^{CDS} = \phi(s - p)\ NT$$

$$CS01^{CDS} = \phi NT \times 0.01\%$$

Asset Swap Spreads

$$s^{ASW} = \underbrace{(r - p)\%}_{Cpn\ Factor} + \underbrace{(100 - B)\% \ / \ T}_{Price\ Factor}$$

Pricing Tricks – Multiples Pricing & Risk

Swap Multiples Pricing

- Knowledge of Liquid Market Par Rates Required
- Precompute a Base Case / Reference Price
- Determine all Prices as a Multiple of a Base Case
- Prices computed this way are an Upper-Bound

Swap Reference Prices

- Price Base Case Units: Per Million, Per Bps, Per Year
- N = USD 1,000,000, (r - p) = 1bps and T = 1.0
- PV(Base Swap) = USD 100

Swap Reference Risk

- Price Base Case Units: Per Million, Per Year
- DV01(Base Swap) = USD 100

Swap PV Multiples

$$PV(1mm, 1\text{bps}, 1y) = USD\ 100$$

$$PV(5mm, 1\text{bps}, 1y) = USD\ 500$$

$$PV(1mm, 5\text{bps}, 1\text{y}) = USD\ 500$$

$$PV(1mm, 1\text{bps}, 5\text{y}) = USD\ 500$$

$$PV(5mm, 5\text{bps}, 5\text{y}) = USD\ 12{,}500$$

Swap DV01 Multiples

$$DV01(1mm, 1\text{y}) = USD\ 100$$

$$DV01(1mm, 5\text{y}) = USD\ 500$$

$$DV01(5mm, 5\text{y}) = USD\ 2{,}500$$

Pricing Tricks – CDS Multiples & ASW Spread Factors

CDS Multiples

- Similar to IRS Multiples
- PV(Base CDS) = USD 100
- CS01(Base CDS) = USD 100

Asset Swap Spread Factors

- Simple addition of Bond Coupon and Bond Price Factors
- Coupon Factor, $C_F = (r - p)$
- Price Factor, $P_F = (100 - B)\% / T$
- Note bond price factor can be negative if B below Par

CDS Multiples

$$PV(1\text{mm}, 1\text{bps}, 1y) = USD\ 100$$
$$PV(1\text{mm}, 1\text{bps}, 5y) = USD\ 500$$
$$PV(1\text{mm}, 5\text{bps}, 5y) = USD\ 2{,}500$$
$$PV(5mm, 5\text{bps}, 5y) = USD\ 12{,}500$$

ASW Spread Factors

$s^{ASW}(C_F\text{=10bps}, P_F\text{=\{100bps,10Y\}})$
$= 10 + 100/10 = 20$ bps

$s^{ASW}(C_F\text{=10bps}, P_F\text{=\{0bps,10Y\}})$
$= 10 + 0/10 = 10$ bps

$s^{ASW}(C_F\text{=10bps}, P_F\text{=\{-100bps,10Y\}})$
$= 10 - 100/10 = 0$ bps

Pricing Tricks – Interest Rate Swap Multiples

Reference Price USD 100 per Million per Year per Δr in bps

IRS Base Cases

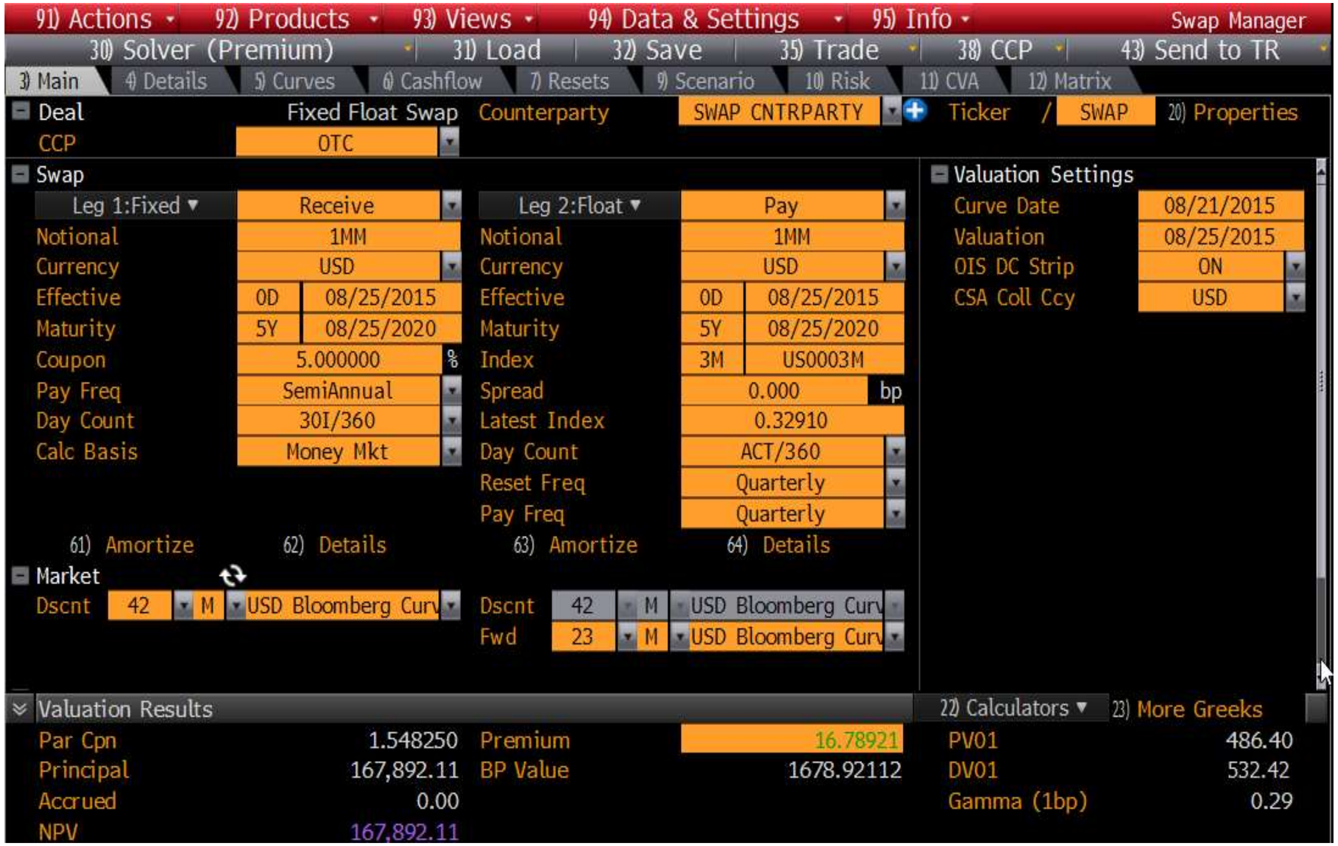
- PV(Base Case) = 100
- DV01(Base Case) = 100

Market Par Rate

- 5Y Par Rate = 150 bps
- Δr = (r-p) = (500-150) = 350 bps

IRS Multiples

- Here ΔN = 1, Δr = 350, ΔT = 5
- PV = 100 x 1 x 350 x 5 = USD 175K
- DV01 = 100 x 1 x 5 = USD 500



Pricing Tricks – Credit Default Swap Multiples

CDS Base Cases

- PV(Base Case) = 100
- CS01(Base Case) = 100

Market CDS Par Rate

- 5Y CDS Par Rate ≈ 140 bps
- Δr = (r-p) = (500-140) = 360 bps

CDS Multiples

- Here ΔN = 10, Δr = 360, ΔT = 5
- PV = 100 x 10 x 360 x 5 = USD 1.8mm
- CS01 = 100 x 10 x 5 = USD 5,000

Reference Price USD 100 per Million per Year per Δr in bps

Pricing Tricks – Asset Swap Spread Factors

Par-Par Spread Factors

$s = (r – p) + (100 – B)\% / T$

$\quad = \text{Coupon Factor } C_F + \text{Price Factor } P_F$

We compute $C_F = (r – p)$ in bps

and $P_F = (B - 100)\% / T$ in bps

Par-Par Spread

For this German Bund we have,

$C_F = 0.50\% – 0.44\% = 6$ bps

$P_F = (100 – 104.580)\% / 10$

$= -458/10 \approx -46$ bps

$S = 6 – 46 = -40$ bps

Swap Risk – Curve Calibration & Risk Hedges

Swap Curve

- Calibrated using 1Y, 2Y, 3Y, 4Y and 5Y swaps
- Bucketed DV01 risk profile shown
- Calibration instruments are the risk hedge instruments

Risk Hedge Instruments

- Consider a portfolio of calibration instruments
- Each with USD 1mm Notional
- Risk from each calibration instrument fits perfectly into

  … calibration risk buckets

Risk Profiles

- **IRS 1Y:** Same Risk as Calibration Instrument
- **IRS(4Y, 5Y):** Equivalent to Long 5Y IRS and Short 4Y IRS
- **IRS(4.5Y):** Equivalent to 50% 4Y IRS and 50% 5Y IRS

Fast Swap Risk – Curve Calibration Instruments

Fast Swap Risk

- Use Multiples Approach for intuition
- Gives a quick risk overview
- A close approximation & upper-bound
- DV01(Base Case) = 100 per Million per Year

Quick Risk

Appendix – Implicit Function Theorem (IFT)

IFT Theorem

To gain some intuition consider the following function $f(x, y) = 0$ for which we have a solution (a, b). Near the solution we can express y as function of x namely $f(x, y(x)) = 0$. Using this expression, we can compute the derivative in terms of x only by differentiating with respect to x as follows,

$$\frac{\partial f}{\partial x} + \frac{\partial f}{\partial y}\frac{\partial y}{\partial x} = 0$$

which gives,

$$\frac{\partial y}{\partial x} = -\left(\frac{\partial f/\partial x}{\partial f/\partial y}\right)$$

We have a solution under the condition, $\partial f/\partial y \neq 0$, since we cannot divide by zero.

Yield Curve Application

In the context of a yield curve calibration, we solve for the solution of a helper target function, $H(L, P) = 0$, where L is the LIBOR forward rate state variable (model output) and P the yield curve par rate (model input). The helper target function computes the difference between model par rates as a function of the forward state variable L and a market instrument par rate quote,

$$H(L, P) = Model\ Par\ Rate(L) - Market\ Par\ Rate$$

How does this Help with Sensitivity Calculations?

The IFT theorem says that having found a solution to the continuously differentiable function $H(L, P) = 0$ in two variables we can express the solution solely in terms of the model output L namely $H(L, P(L)) = 0$ and that the Jacobian derivative can be computed independent of model inputs i.e., the yield curve instruments and par rates as,

$$\frac{\partial P}{\partial L} = -\left(\frac{\partial H/\partial L}{\partial H/\partial P}\right)$$

Now, from the definition of the function $H(L, P)$ we can easily determine $dH/dP = -1$ which leads to,

$$\frac{\partial P}{\partial L} = -\left(\frac{\partial H/\partial L}{\partial H/\partial P}\right) = \frac{\partial H}{\partial L}$$

$$= \frac{d}{dL}(Model\ Par\ Rate)$$

For an Interest Rate Swap

$$Par\ Rate, p = \frac{PV(Float\ Leg)}{\sum_{i=1}^{n} N\ \tau_i\ P(t_0, t_i)} = \frac{\sum_{j=1}^{m} N\left(\ l_{j-1} + s\right) \tau_j\ P\left(t_0, t_j\right)}{Annuity(Fixed)}$$

- The derivative with respect to L is trivial to calculate
- We can calculate for any set of calibration instruments
- This allows us to modify and select any risk & hedge buckets

Appendix – Swap DV01 Risk Example using AAD (Part I)

IRS Present Value Code

- Swap Price Implementation
- Simplified for Demo Purposes
- For Full Example See

  https://bit.ly/SwapCodeAAD

```
// Swap Inputs
//   phi     Pay or Receive Fixed: Pay = 1,  Receive = -1
//   n       Swap Notional
//   r       Fixed rate
//   tau     Accrual year fraction
//   t       Coupon Payment Time
//   f       Floating Forward Rate
//   s       Floating Spread
//   z       Discounting Zero Rate for Discount Factor, where df = exp(-z*t)

double swap_pv(double phi, double n, double r, double tau, double t, double f, double s,
double z)
{
    double df          = exp(-z*t);                 // Step 1.  Discount Factor using zero rate, z
    double pv_fixed = phi*n*r*tau*df;           // Step 2.  Fixed PV = $\varphi N r \tau_1 P(0,t_1)$
    double pv_float  = -phi*n*(f+s)*tau*df;   // Step 3.  Float PV = $\varphi N(l_1 + s)\tau_1 P(0,t_1)$
    double pv_swap = pv_fixed+pv_float;        // Step 4.  Swap PV = Fixed PV + Float PV
    return pv_swap;
}
```

Swap Price

Appendix – Swap DV01 Risk Example using AAD (Part II)

Analytical DV01 Risk

- Using Adjoint Mode (AAD)
- Forward Sweep for Price
- Back Propagation for Risk
- Simultaneous Forward and Discount Risk

Source Code: https://onlinegdb.com/5U3IChYiD

```
double adjoint(double phi, double n, double r, double tau, double t, double f, double s,  double z, double pv_bar)
{
    // Forward Sweep
    double df               = exp(-z*t);                // Step 1.  Discount Factor using zero rate, z
    double pv_fixed         = phi*n*r*tau*df;           // Step 2.  Fixed PV = ϕ N r τ_1 P(0,t_1 )
    double pv_float         = -phi*n*(f+s)*tau*df;      // Step 3.  Float PV = ϕ N(l_1+s) τ_1 P(0,t_1 )
    double pv_swap          = pv_fixed+pv_float;        // Step 4.  Swap PV = Fixed PV + Float PV

    // Backward Propagation
    double pv_fixed_bar     = pv_bar;                                         // Step 4.
    double pv_float_bar     = pv_bar;                                         // Step 4.
    double f_bar            = -phi*n*tau*df*pv_float_bar*shift_size_f;        // Step 3. *
    double df_bar           = -phi*n*f*tau*pv_float_bar*shift_size_df;        // Step 3. *
    df_bar                  += phi*n*r*tau*pv_fixed_bar*shift_size_df;        // Step 2. *
    double z_bar            = -t*exp(-z*t)*df_bar;                            // Step 1.

    // DV01 Result
    return f_bar + df_bar;  // Sensitivity to 1 bps change in forwards and discount factors
}
```

Swap DV01 using AD in Adjoint Mode

```
// inputs( phi, n, r, tau, t, f, s, z, pv_bar )
adjoint( 1, 1000000, 0.02, 1, 1, 0.01, 0, 0.02, 1 );  // Output DV01 Risk
```

Swap DV01 Risk using Adjoint Mode
